ABSTRACT:

PROBLEM TO BE SOLVED: To distribute a protected software application from center
service facilities 22 to a remote system 12 and to manage the distribution
according to the community membership of a remote system user.

SOLUTION: A business rule 118 is used to decide whether or not a specific
identified user is allowed to access the protected software application from a
specific remote site. A Web server 110 is so programmed that a remote system user
can selectively access a resident software program through a network 80. The access
is managed by a center policy server 114 according to users, system information,
and community definitions stored in a database 116. The policy server communicates
with respective Web servers through proxy modules 112 incorporated in the Web
servers. A proxy module intercepts an access from a remote system user and then
interfaces with the policy server.
